

## Application Deployment Process Through Microsoft Intune

To deploy a Win32 application via Microsoft Intune, you must first convert the app installation files into the .intunewin format using the Microsoft Win32 Content Prep Tool. Here's a simplified process:

1. **Download the Tool** – Get the Win32 Content Prep Tool from Microsoft's official site.
2. **Prepare the App Package** – Use the tool to convert your installer files (e.g., .msi, .exe, .msu) into a .intunewin package.
3. **Upload to Intune** – Go to the Intune admin center and upload the generated .intunewin file as a new application.
4. **Configure App Details** – Provide necessary metadata such as app name, description, install/uninstall commands, and privacy settings.
5. **Assign the App** – Deploy the app to specific user or device groups within your organization to initiate installation on managed Windows devices.
